GONG.IO

Comprehensive Product Teardown

Competitive Intelligence for Signal Platform

Date: March 22, 2026
Source: help.gong.io (primary), gong.io blog/press (supplementary)
Method: Systematic reverse-engineering from public help documentation

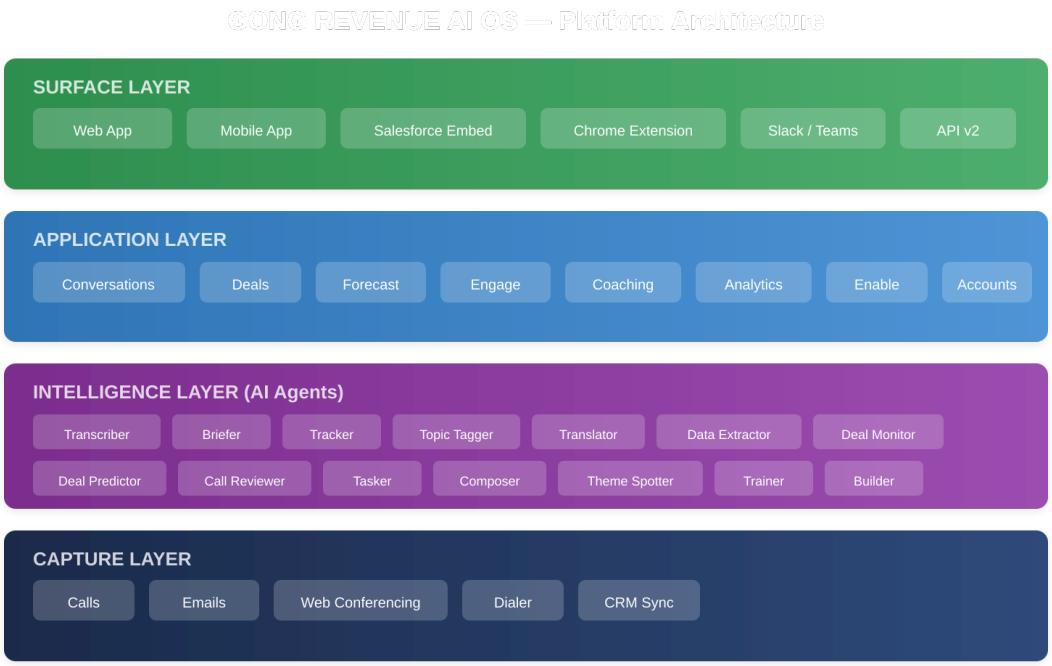
1. Product Overview & Architecture

Product Identity

Gong positions itself as a **"Revenue AI OS"** (Operating System) — not just conversation intelligence. The platform has evolved from a call recording/analysis tool into a full revenue operations platform.

Product Surface Area

The Gong platform is organized into four distinct layers, from data capture at the bottom through to the user-facing surfaces at the top:



Navigation Structure

The main sidebar navigation organizes Gong into these primary areas: **Home** (Activity Feed), **Conversations** (My Calls, Team Calls, All Calls, Search, Library), **Deals** (Deal Boards, Pipeline View), **Forecast** (Forecast Boards, Pipeline View), **Engage** (To-dos, Flows, Templates, Contacts, Analytics), **Coaching** (Scorecards, Coaching Metrics, Initiatives), **Insights** (Team Stats, Initiative Boards), **Accounts** (Account Console, Account Boards), **Dashboards** (Revenue Analytics), and **Admin Center** (Agent Studio, Settings).

ARR & Scale

Metric	Value
Annual Recurring Revenue	$300M+ (surpassed March 2025)
Customer Organizations	5,000+ globally (as of March 2026)
AI Usage Growth	~50% YoY

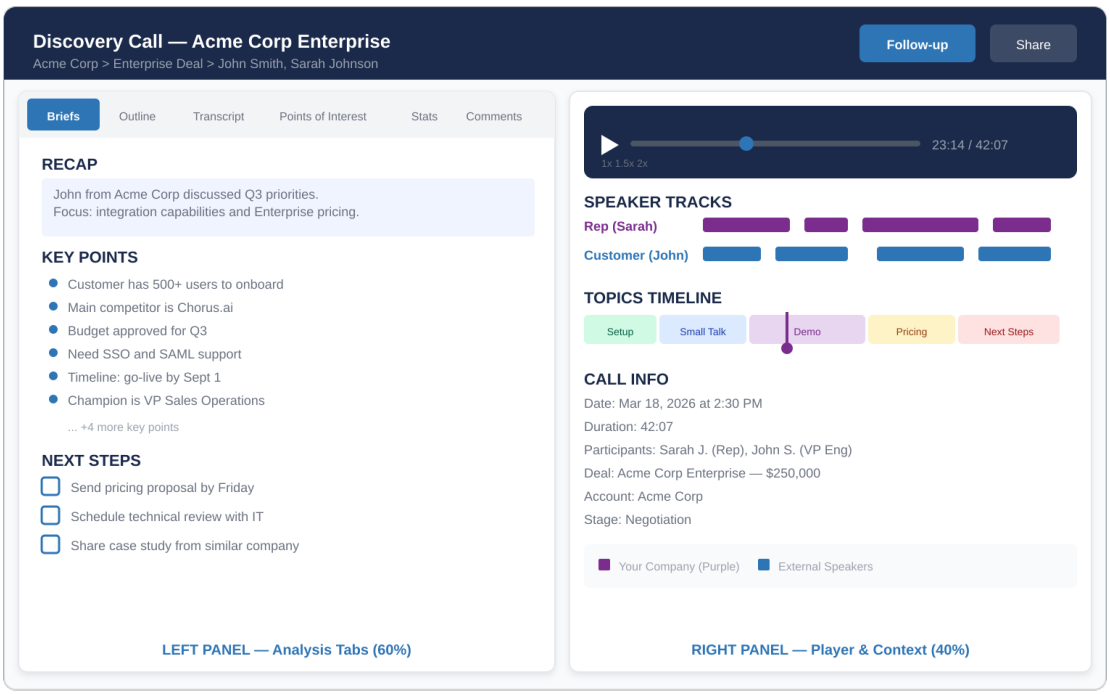
Metric	Value
Ask Anything Usage Growth	400%+ YoY
Industry Recognition	Leader in 2025 Gartner Magic Quadrant for Revenue Action Orchestration
Average ACV	~$60K (implies enterprise focus, not SMB)
Training Data	3B+ customer interactions (proprietary)

2. Calls & Conversations (Core Product)

The call page is the atomic unit of Gong. Every other feature references back to it. Below is the detailed layout of how Gong presents a single call for review.

2.1 Call Page Layout

Call Page Layout — The Atomic Unit of Gong



What the User Sees

Split layout with content analysis on the left (60%) and playback/context on the right (40%). A **tab bar** across the top of the left panel provides access to: Briefs, Outline, Transcript, Points of Interest, Stats, Comments, and Scoring. The right side shows the call player with video/audio, speaker tracks below, topics timeline below that, and call metadata.

What the User Does

Switch between tabs to explore different analysis views of the same call. Click speaker tracks to mute/unmute individual speakers. Drag the purple scrubber on the topics timeline to jump to any conversation segment. Generate AI follow-up email with one click. Share the call with internal colleagues or external customers. Add comments at specific timestamps. Score the call using scorecards.

What This Implies (Layer 3 Analysis)

The data model ties every call to Account, Deal, and Contact objects from CRM. Speaker diarization is a core capability (separate audio tracks per participant). Topic segmentation runs automatically post-recording using patented technology. The call page is designed for async review — you don't need to listen live. The tab-based architecture means each analysis dimension is independent but references the same underlying call data.

2.2 Call Player & Speaker Tracks

Audio/video player with standard controls, playback speed (1x, 1.5x, 2x), and 15-second skip forward/backward. Speaker tracks are shown as horizontal bars beneath the player. **Company speakers are marked in purple**; external speakers in a different color. Each speaker has a mute/unmute toggle.

> *Key insight: Audio is stored per-speaker, not as a single mixed track (enabling mute/unmute). Responsive design breakpoint at 1512px suggests detailed call review is optimized for desktop. Company vs. external classification is automatic based on email domain matching to CRM.*

2.3 Call Briefs / AI Briefer

The AI Briefer is Gong's generative AI summary engine (formerly "Call Spotlight"). It generates structured summaries automatically after each call with no user action required.

Brief Type	Purpose	Sections Generated
Highlights (default)	General summary	Recap, Key Points (10 bullets), Next Steps
Solution Review	Demo calls	Customer feedback, questions, product fit
Commercial Alignment	Late-stage calls	Contract terms, negotiations, pricing
Custom	Admin-defined	Configurable sections with custom instructions

Custom brief types can pull data from three sources: **Conversations** (Gong call data), **Web** (external research — notably, Gong can augment call context with web information), and **CRM/Gong data** (structured fields).

> *Key insight: The AI Briefer is one of 16+ "AI Agents" in Gong's Agent Studio. 10-bullet key points suggest a fixed extraction schema rather than dynamic length. Next Steps extraction identifies action items from BOTH sides of the conversation.*

2.4 Transcript

Full call transcript displayed in the Transcript tab with speaker names labeled with timestamps. Includes search-within-transcript, topic/tracker mention highlights, and a translation button. Vocalized pauses (um, uh, hmm) are automatically omitted for readability.

> *Gong uses its own ASR ("AI Transcriber" agent). Custom vocabulary can be added to improve company-specific terms. Multi-language support with quality tiers: "hyper-optimized" languages vs. "standard" languages. The transcript is the ground-truth data layer — all other AI features derive from it.*

2.5 Call Stats (Interaction Metrics)

Gong tracks six core interaction metrics powered by an engine called "Whisper":

Metric	Definition	Benchmark
Talk Ratio	% of call where team member spoke	≤65% recommended
Longest Monologue	Duration of longest uninterrupted speech by team member	≤2:30 minutes
Longest Customer Story	Duration of longest customer-talking segment	Longer = better

Metric	Definition	Benchmark
Interactivity	How often conversation switches between parties	Higher = more engaging
Patience	How long rep waits after customer finishes	0.6–1.0 seconds
Questions	How often team member asks questions per hour	Higher = better discovery

Whisper must be enabled per workspace. Benchmarks are derived from Gong's analysis of "hundreds of thousands of calls." Metrics are designed for 1:1 sales calls; multi-party calls have different dynamics. Notably: no mention of sentiment analysis as a metric — Gong focuses on behavioral/structural metrics, not emotional.

2.6 Points of Interest

Dedicated tab showing: **Questions asked**, **Tracker mentions**, and **Filler words** — each linked to a timestamp in the call.

Important distinction: Filler words are NOT vocalized pauses (um, uh, hmm — those are omitted from transcripts). Filler words = "like," "you know," "sort of" — flagged only when used significantly more than average. Gong separates disfluency detection (transcript cleanup) from behavioral flagging (coaching).

2.7 Topics Timeline

Horizontal bar at the bottom of the call player showing color-coded topic segments (e.g., Call Setup, Small Talk, Demo, Pricing, Next Steps, Wrap-up). Click any segment to jump to that section. Purple scrubber/playhead for navigation.

Default topics come from a base model. Admins can generate **custom topic models** specific to their business. Topics are discovered through unsupervised learning, not pre-defined.

Protected by US Patent #10,642,889: "Unsupervised automated topic detection, segmentation and labeling of conversations." Three-phase process: (1) Segmentation into coherent chunks, (2) Initial hypothesis via rough clustering, (3) Iterative refinement until topics converge. This is genuinely unsupervised — topics emerge from the data, not from keyword lists.

2.8 Ask Anything / Gong Assistant

Ask Anything (on a call): Single natural-language question about one call transcript. **Ask Anything (on a deal/account/contact)**: Searches across up to 60 calls and 500 emails. **Gong Assistant**: Full conversational AI interface with follow-up questions and context awareness.

Gong Assistant is the evolution from single Q&A to multi-turn conversational AI. It has access to: call transcripts, participants, accounts, deals, and CRM data. 400%+ YoY growth indicates strong product-market fit. Trained on 3B+ customer interactions (proprietary foundation). Available on mobile.

2.9 Scorecards & AI Call Reviewer

Scorecards are configurable evaluation forms that assess calls against specific criteria. They can be scored manually by managers or automatically by the **AI Call Reviewer** agent.

Manual scoring: Manager reviews call and rates each question (Yes/No or 1-5 scale). **AI suggestions**: AI pre-fills answers with evidence citations from the transcript. Manager can accept/override. **Automatic scoring**: AI Call Reviewer scores every call without human intervention.

> *The AI Call Reviewer can suggest scores with transcript evidence, but managers always have override authority. This is a methodology compliance tool (did the rep follow MEDDIC/BANT/Challenger?) — not a psychological analysis tool.*

2.10 Comments & Snippets

Comments: Text annotations linked to specific timestamps in the call. Support @mentions, emoji reactions, and threaded replies. Notifications sent to mentioned users. **Snippets**: Shareable clips from specific moments in a call. Used for training libraries and highlighting teachable moments.

2.11 Smart Trackers & Keyword Trackers

Smart Trackers are Gong's concept-detection system, built to go beyond keyword matching. They detect semantic meaning across different phrasings. Two types:

Type	How It Works	Limit	Use Case
Question-Based	Natural language question (e.g., "Did the customer mention budget?")	20 per workspace	Quick, no training data needed
Example-Based	Provide 5-50 example phrases; AI learns the concept	100 per workspace	Complex concepts, higher precision
Pre-Trained	Gong-maintained library of common sales concepts	Varies	Out-of-box coverage
Keyword Trackers	Exact word/phrase matching (literal)	Unlimited	Names, product terms, competitors

> *The Sept 2025 shift to question-based trackers is a major architectural change — moving from training-data-dependent to prompt-based. Trackers integrate into: deal boards, playbooks, scorecards, initiative boards, and search filters. This is one of Gong's strongest moats: years of training data + patented concept detection.*

2.12 Search

Global search across all transcripts with operators (exact phrase with quotes, OR with pipe). Filters include: participant, account/deal, deal stage, region/owner, date range, trackers, topics, and call type. Saved searches can create **Streams** that auto-collect matching calls (continuous search pattern).

2.13 Follow-Up Email Generation

Email Variant	Content	Best For
General Summary	Full background + next steps	First-time follow-up
Action-Oriented	Brief background + next steps	Established relationships
Detailed Summary	Key updates, decisions, next steps	Internal calls only

Emails are generated in the same language as the call. Sent via Gong email composer with automatic open/click/reply tracking.

2.14 Call Recording Methods

Method	Platform	How It Works
Native Recording	Zoom, Microsoft Teams	Uses platform's recording API directly
Bot Recording	Google Meet, others	"Gong Recorder" joins as visible participant
Dialer Integration	RingCentral, Aircall, Dialpad, Outreach	Direct telephony integration
Gong Dialer	Built-in	Gong's own dialer for outbound calls
Gong Connect	Mobile	Make/receive calls from mobile, auto-captured
Import	Any source	Upload recordings manually

3. Deals & Pipeline Intelligence

3.1 Deal Board

The deal board is a tabular view with all active deals from CRM. Each row represents one deal with visual indicators for health, inline editing of CRM fields (syncing back to CRM), and one-click access to the deal panel.

Deal Board — Pipeline Intelligence View

DEAL NAME	SCORE	WARNINGS	CONTACTS	ACTIVITY (21d)	PLAYBOOK (MEDDICC)	AMOUNT
Gamma Corp Enterprise Stage: Negotiation	91	✓ None	6 / 6	■■■■■	●●●●●●●	$380K
Acme Corp Mid-Market Stage: Qualification	52	⚠ 3	3 / 5	■□□■□	●●○○●○○	$120K
Beta Solutions Startup Stage: Discovery	28	⚠ 5	1 / 4	□□□□□	●○○○○○○	$45K

SCORE KEY: 70+ Healthy · 40-69 At Risk · <40 Critical **PLAYBOOK:** ● Element fulfilled ○ Not yet detected

ACTIVITY: ■ Active day □ No activity Score = percentile rank (not probability). Based on 300+ ML signals from your company's deal history.

The Score column drives prioritization behavior — reps focus on low-score deals. Playbook columns show methodology compliance per deal element (e.g., M-E-D-D-I-C-C). The deal board is a read-write view of CRM data, not just display.

3.2 Deal Panel

Clicking a deal name opens a side panel with four tabs:

Overview/Brief: AI deal summary, likelihood score, health brief, and active warnings.

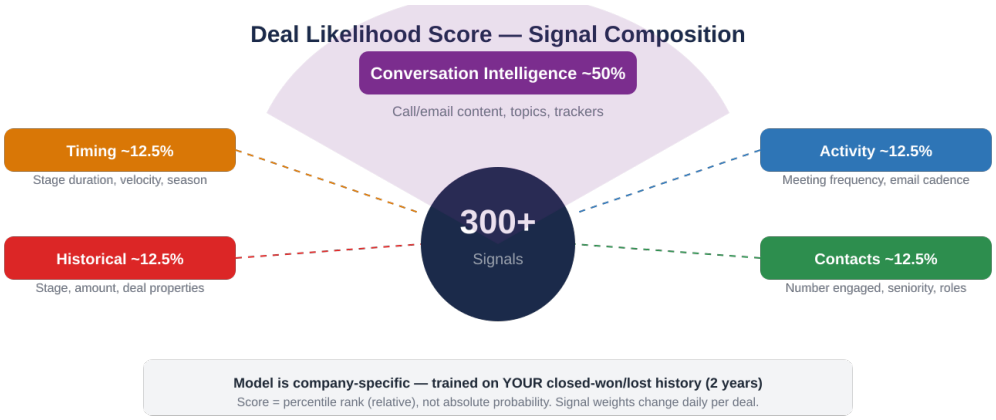
Activity: Chronological timeline of all interactions (calls, emails, meetings).

Contacts: All stakeholders on both sides with engagement levels.

CRM: All mapped CRM fields, editable in-place with bi-directional sync.

3.3 Deal Likelihood Scores (AI Deal Predictor)

The AI Deal Predictor analyzes **300+ signals** using an ML model trained on YOUR company's historical deal outcomes. It looks back 2 years at all closed deals to learn patterns.



The score is a percentile rank (not absolute probability). Score of 80 = better chance of closing than 80% of other open deals. The model is company-specific. Signal weights change daily per deal as new data comes in. The 50/50 split between conversation and non-conversation signals validates that Gong sees conversation data as their primary differentiator.

3.4 AI Deal Monitor & Warnings

Warning Type	Trigger	Signal
No activity for X days	No calls or emails detected	Deal going cold
No prospect activity	No external participant engagement	Customer disengaged
Red flag email	Prospect email flagged as risk	Deal in jeopardy
Budget constraints	Conversation mentions budget issues	Financial risk
Changing priorities	Conversation mentions shifting focus	Strategic risk
Single-threaded	Only 1 contact active in last 30 days	Risk of champion loss
Ghosting	Prospect inactive for N days	Need to re-engage

AI Deal Monitor is an always-on agent, not triggered by user action. It models expected deal cadence and flags deviations. This is the proactive intelligence layer — it finds problems before users ask.

3.5 AI Deal Reviewer & Playbooks

Available playbook templates: **MEDDICC**, **BANT**, **SPIN**, **Challenger**, **SPICED**, **Solution Selling**, **Sandler**, and **Custom**. Each playbook contains elements (e.g., M-E-D-D-I-C-C), each element maps to a smart tracker, and the AI Deal Reviewer finds conversations that fulfill each element, scoring completeness as a visual checklist.

3.6 Account Console & Account Boards

New as of Mission Andromeda (Feb 2026). **Account Console**: Unified view of an account spanning pre-sale and post-sale activity. **Account Boards**: Board view with AI insights and risk signals for renewals/expansion. This unifies the customer lifecycle that was previously split between sales tools and CS tools.

4. Forecasting

Forecast boards replace spreadsheet-based forecasting. Rows represent teams or individuals. Columns are based on three types: **Forecast Submissions** (numbers submitted by reps/managers), **Metrics** (calculated from CRM/Gong data), and **Targets** (goal numbers set by leadership).

Key features include: forecast category definitions driven by CRM conditions, rollup boards that aggregate across teams/business lines, submission workflows where reps submit and managers adjust/override, submission tracking showing completion (e.g., "8/10"), weighted pipeline applying historical conversion rates per stage per time-in-quarter, and formula metrics (gross retention, net retention, forecast coverage, etc.).

> *The submission/override hierarchy mirrors the org chart (rep > manager > VP > CRO). Mobile submission is supported. This differentiates from Clari (pure CRM-based) by incorporating conversation signals — what was actually said in calls.*

5. Engage (Sales Engagement)

Gong Engage competes directly with Outreach, SalesLoft, and Apollo. The integration of engagement + conversation intelligence in one platform is the key differentiator.

5.1 Flows (Sequences/Cadences)

Step types include: **Auto Email** (fully automated), **Manual Email** (rep personalizes before sending), **Call** (via Gong dialer, creating a closed loop), **LinkedIn Connect/Message** (manual, tracked), and **Custom Tasks**. Flows can be company-level (admin-managed, shared) or personal.

5.2 Email Composer & AI Composer

Write and send emails from within Gong with templates, variable substitution, reusable content blocks, and tracking (opens, clicks, replies via invisible pixel + link wrapping). The **AI Composer** generates contextual email drafts based on conversation context, offers AI rephrasing suggestions, and auto-generates personalized drafts for Gong-recommended to-dos.

5.3 Power Dialer

Built-in dialer for outbound calls that integrates with flow call steps. Includes call script templates. Calls are automatically recorded and captured in Gong. Available on mobile via Gong Connect.

5.4 To-Dos & AI Tasker

To-do sources include: **Gong-Recommended** (AI identifies action items from calls/emails), **Flow To-Dos** (from active flow steps), **User-Created** (manually), and **Manager-Assigned**. The AI Tasker surfaces high-impact to-dos, auto-generates email drafts for follow-ups, sends daily summaries via email and Slack, and auto-removes recommended to-dos after 7 days to prevent task list rot.

5.5 Engage Analytics

Metrics tracked: people added/active/completed in flows, email open/click/bounce/reply rates, call connect rate, average call duration, and meetings booked.

> *Best practice insights from Gong's data: Manual emails outperform auto emails. Cold call first = 2x email reply rate. Voicemail = 2x likelihood of email reply. Average Engage users see 34% higher response rate.*

6. Coaching

6.1 Coaching Workflows

Manager tools include: call scorecards (configurable criteria), comment threads on specific call moments, performance benchmarking (rep vs. team vs. org averages), coaching tasks and feedback centralized in one interface, manager coaching activity tracking, "snippet" sharing for teachable moments, and call libraries for curating best-of examples.

6.2 Initiative Boards

Initiative Boards connect enablement programs directly to revenue metrics. Example: tracking adoption of a new sales methodology. Each initiative links specific trackers (e.g., "Discovery questions," "Decision process") and visualizes per-rep adoption rates and trends over time.

> *This bridges the gap between "training completed" and "behavior changed" — one of the highest-value coaching features in the platform.*

6.3 Coaching Metrics

Team stats page with tabs for: Activity, Interaction, Topics, Trackers, Smart Trackers, Scorecards, Gong Usage, and Coaching Received. Interaction metrics are shown per-rep across the team with horizontal bar charts, best practice lines, and team average markers.

7. Analytics & Dashboards

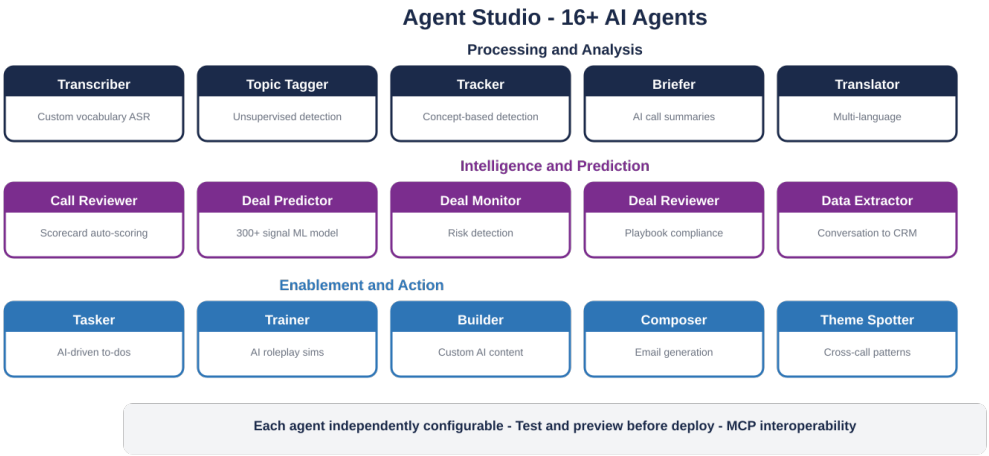
Revenue Analytics dashboards with **8 widget types**: Area, Column, Heatmap, Number, Funnel, Table, Bar, and Pie. Custom metrics supported (create derivative measures from existing data). Widget filters: date range, team, pipeline, CRM fields.

Dashboards are configurable but require RevOps expertise to set up well. The dashboard builder is a BI-lite experience within the Gong platform.

8. Admin & Settings

8.1 Agent Studio & AI Agents

Agent Studio is the central hub for discovering, configuring, and deploying all AI agents. Each agent is independently configurable and deployable with a "test and preview before deploy" capability.



8.2 Permissions & Workspaces

Role Hierarchy: Tech Admin (infrastructure, integrations), Business Admin (trackers, scorecards, AI settings), Manager (team oversight, coaching, forecasts), User/Rep (individual call review, engagement, deals). Permission profiles are assigned per workspace per team member with granular controls.

Workspaces: Unlimited workspaces for plans purchased after March 2025. Each team member has a "Home workspace." Separate workspace = separate data boundary, supporting multi-BU enterprises with data isolation needs.

8.3 CRM Integrations

Supported CRMs: **Salesforce**, **HubSpot**, **Microsoft Dynamics 365**. Limitation: only ONE CRM connected at a time. Bi-directional field sync with up to 50 fields per object (HubSpot). Gong for Salesforce provides embedded panels within Salesforce with audio player, statistics, transcript, and scorecard access.

8.4 Integrations Ecosystem

Category	Integrations
Web Conferencing	Zoom (native), Microsoft Teams (native), Google Meet (bot), Webex, GoTo Meeting, BlueJeans
Dialers	RingCentral, Aircall, Dialpad, Five9, Genesys, NICE, Outreach, SalesLoft
Email & Calendar	Gmail, Outlook, Google Calendar, Outlook Calendar
Messaging	Slack, Microsoft Teams (chat)
Data/Intelligence	ZoomInfo, 6sense, Clearbit, LinkedIn Sales Navigator
AI Interop	MCP support for Salesforce Agentforce, Microsoft Copilot, HubSpot

8.5 Security & Compliance

Consent profiles configurable per team/geography (GDPR). Recording settings configurable per workspace. Calendar sync required for auto-detection of meetings. Sensitive data masking in transcripts.

8.6 Gong Anywhere

Chrome Extension and Outlook Add-in that extends Gong capabilities into the browser and email client. Enables viewing call data, deal context, and AI insights without switching to the Gong web app.

9. Recent Product Updates (Last 12 Months)

Date	Release	Key Features
Feb 2026	Mission Andromeda	Gong Enable, Gong Assistant, Account Console, Account Boards, MCP support
Jan 2026	AI Call Reviewer Update	Improved scoring accuracy for automatic review scorecards
Oct 2025	MCP Support	AI interoperability with Salesforce Agentforce, MS Copilot, HubSpot
Sep 2025	Question-Based Trackers	New default tracker builder; no minimum call volume; multi-language
Jul 2025	Agent Studio Launch	Central hub for managing all AI agents
Mar 2025	Unlimited Workspaces	All plans include unlimited workspace creation
Mar 2025	$300M ARR Milestone	Business scale validation

Mission Andromeda Highlights

Gong Enable: New product line for AI-powered revenue enablement. Includes AI Call Reviewer and AI Trainer (roleplay simulations). Priced at "tens of dollars per seat per month." Positioned against Seismic, Highspot, Brainshark.

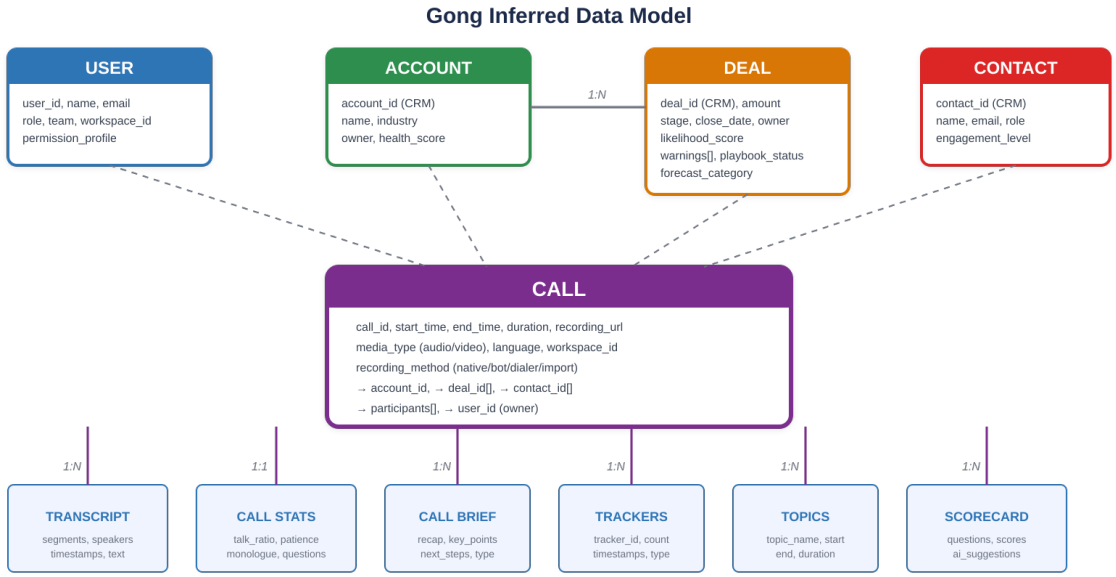
Gong Assistant: Full conversational AI evolving from single-shot Ask Anything to multi-turn conversations. Context-aware across calls, participants, accounts, and deals.

Account Management: Account Console (unified account view) and Account Boards (board view with AI insights). Unifies pre-sale and post-sale into a single view.

AI Interoperability: First in category to support MCP (Model Context Protocol) as both client and server. Enables third-party AI systems to access Gong data with clear controls over data access, usage, and provenance.

10. Inferred Data Model

Based on help documentation and API references, the following data model is inferred:



Key relationships: Call 1:N Participants, Call 1:N Transcript Segments, Call 1:1 Interaction Stats, Call 1:N Tracker Mentions, Call 1:N Topic Segments, Call 1:N Notes/Comments, Call 1:N Scorecard Results, Call N:1 Account, Call N:M Contacts, Call N:M Deals, Deal 1:N Calls, Deal 1:N Emails, Deal 1:N Warnings, Deal 1:1 Likelihood Score, Deal 1:N Playbook Elements, Account 1:N Deals.

11. Feature Inventory

Complete feature inventory with moat assessment (64 distinct features mapped):

#	Feature	AI-Powered	Requires Add-on	Competitive Moat
1	Call Recording (Multi-platform)	No	Core	Low
2	Speaker Diarization	Yes	Core	Medium
3	Transcript Generation	Yes (AI Transcriber)	Core	Medium
6	Topic Segmentation	Yes (AI Topic Tagger)	Core	HIGH (patented)
8	Call Briefs / AI Briefer	Yes (AI Briefer)	Core	Medium
10	Call Stats (6 metrics)	Yes (Whisper)	Core	Medium
13	Smart Trackers (Question)	Yes (AI Tracker)	Core	HIGH
17	Ask Anything (Call)	Yes	Core	HIGH
19	Gong Assistant (Conversational)	Yes	Core	HIGH
22	AI Call Reviewer (Automatic)	Yes	Core	HIGH
33	Deal Likelihood Scores	Yes (AI Deal Predictor)	Deals add-on	HIGH
34	AI Deal Monitor / Warnings	Yes (AI Deal Monitor)	Deals add-on	HIGH
35	Playbooks (7 templates)	Yes (AI Deal Reviewer)	Deals add-on	HIGH
44	AI Email Composer	Yes (AI Composer)	Engage add-on	Medium
46	To-Dos / AI Tasker	Yes (AI Tasker)	Engage add-on	Medium
50	Initiative Boards	Yes	Core	HIGH
54	AI Data Extractor	Yes	Core	HIGH
57	AI Theme Spotter	Yes	Core	HIGH
59	MCP Support	N/A	Core	HIGH (first-mover)

Of the 64 mapped features, 12 are assessed as HIGH competitive moat. The strongest moats are in AI-powered analysis features backed by years of training data and patented technology.

12. Design Decisions Analysis

Architecture Decisions

Decision	Choice Made	Alternative	Why This Choice
Core data model	CRM-mirrored (Account > Deal > Contact > Call)	Standalone	Forces CRM integration; ensures data context
AI architecture	Named agents in Agent Studio	Monolithic AI	Modularity, independent deployment, clearer mental model
Tracker approach	Concept-based (AI) + keyword (literal)	Keyword-only	Catches semantic variations; handles evolving language
Call stats engine	Separate "Whisper" system	Embedded in transcription	Independent optimization; can run different models
Topic detection	Unsupervised clustering (patented)	Pre-defined topic lists	Discovers company-specific topics without configuration
Forecast data	Spreadsheet-like boards + CRM metrics	CRM-only	Familiar mental model; real-time CRM connection
Engagement	Built-in (Engage)	Integration-only	Closed loop: engage > call > analyze > coach
Scoring model	Percentile rank (relative)	Absolute probability	Relative ranking is more actionable
Multi-language	Hyper-optimized vs. standard tiers	Equal quality all languages	Honest about quality differences
Brief types	Customizable templates	Fixed summary format	Different call types need different extraction
Workspace model	Unlimited, permission-profile-per-workspace	Single workspace	Supports multi-BU enterprises

UX Design Patterns

Pattern	Implementation	Purpose
Tab-based call page	7 tabs (Briefs, Outline, Transcript, etc.)	Progressive disclosure; each dimension independent
Side panel for deals	Click-to-expand 4-tab panel	Detail-on-demand without losing board context
Purple = your company	Consistent color coding across all views	Instant visual identification of "us vs. them"
Floating player	Player floats on screens < 1512px	Responsive; always-visible playback
7-day auto-removal	Gong-recommended to-dos expire	Prevents task list rot; keeps recommendations fresh
Inline CRM editing	Edit CRM fields directly in Gong	Reduce context switching; single pane of glass

Product Strategy Decisions

Decision	Implication
"Revenue AI OS" positioning	Platform play, not point solution; justifies expanding into adjacencies
Named launch cadences (Mission Andromeda)	Apple-style product events for market attention; quarterly rhythm
MCP support (first in category)	Bet on interoperability; acknowledges multi-vendor AI future
Gong Enable as separate product	Revenue enablement is next TAM expansion (vs. Seismic/Highspot)
$300M ARR at 5,000 customers	~$60K average ACV; enterprise-focused, not SMB
3B+ interaction training data	Proprietary data moat; competitors can't replicate without scale

13. Pricing & Packaging

Pricing model: Per-seat, per-year, custom-quoted (no self-serve).

Core Tiers

Tier	Annual Per-Seat	Platform Fee	Key Inclusions
Gong Foundations	~$1,600/user/year	~$50,000	Core conversation intelligence, call recording, briefs, search
Standard	~$1,400–$2,000	Included	Foundations + additional features
Advanced	~$1,800–$2,600	Included	Full feature set

Add-On Modules

Module	Cost	Features
Gong Engage	~$800/user/year	Flows, dialer, email composer, to-dos, engage analytics
Gong Forecast	~$700/user/year	Full forecast boards, projections, weighted pipeline
Gong Forecast Essentials	~$300/user/year	Basic forecasting
Gong Enable	"Tens of dollars/seat/month"	AI Trainer, coaching tools, enablement

Typical Deployment Costs

25–75 seats: $1,400–$2,000/seat (1-year contracts). **100+ seats**: Volume discounts negotiable. 15–25% discount typical through negotiation. Multi-year discounts available.

Estimated Total Cost: 50-seat deployment with Engage + Forecast: ~$150K–$200K/year. 200-seat enterprise deployment: ~$400K–$600K/year.

> *The $1,600 list price that once included all features now only covers core conversation intelligence. Adding Forecast, Engage, and Enable pushes total per-user cost to $3,000–$3,500/year.*

14. What We Can't See (Intelligence Gaps)

Areas requiring live product access to fully assess:

Data & Processing Gaps

Gap	Why It Matters	How to Get It
Exact ASR accuracy rates per language	Baseline for our transcription quality	G2 reviews, user interviews, trial
Transcript processing latency	User experience expectation	Trial account
Topic model training time/data requirements	Architecture sizing	Trial + admin access
Deal likelihood recalculation frequency	Real-time vs. batch processing	API testing
Smart tracker precision/recall rates	Detection quality baseline	Trial with test calls
AI Briefer generation latency	User experience benchmark	Trial account

UX & Interaction Design Gaps

Gap	Why It Matters	How to Get It
Exact layout dimensions/proportions	UI benchmarking	Screenshots, trial
Loading states and skeleton screens	Perceived performance patterns	Trial recording
Error and empty states	Design completeness	Systematic testing
Onboarding flow for new users	Activation funnel design	New trial signup
Dashboard builder interaction model	BI-lite UX patterns	Trial
